

Secure Multi-Tenanted Cloud Print Solution

JOIN THE GLOBAL CLOUD PRINT REVOLUTION!

ePRINTit provides a true cloud printing solution fit for modern IT. With over 20 years experience in end-user computing, we recognise that traditional on-premise printing solutions are simply not aligned to modern IT strategies. ePRINTit hosts the largest multi-tenanted Cloud Printing platform in the world and our customers love it!

Our enhanced security using end-to-end AES 256-bit encryption forms the building blocks for the ePRINTit cloud solution which only requires internet access for users and printers.

Any Device, Any Application, Any Cloud

The “Any, Any, Any” scenario drives modern IT strategies whether its related to hosted application delivery, virtual desktops, user profile management, etc. and this requirement is also placed on printing too. The user does not want to have their capabilities limited for printing just because they are using a different user device or when not connected to their corporate environment.

The limitations of the traditional on-premise print solutions bind the user to the corporate network for the simple act of file and print. At ePRINTit, we recognise that users are more mobile than ever before and they only need internet access to work in modern IT environments.

With no VPN in sight or holes in firewalls, ePRINTit leverages HTTPS for the user to simply **file and print**. The process applies AES 256-bit encryption to the print transmission and to the document when at rest in the system. The user can file and print wherever they are from any device, in any application, and from any cloud context they are using.

Mobile, BYOD, ChromeBook, Windows, Mac - We got you covered!

With your organisation set up in an ePRINTit cloud service your users will be able to print from any of their devices. They will even be able to submit documents directly from their Office365 accounts, personal cloud storage like Dropbox or Box. They can also add multiple email accounts to the ePRINTit mobile app to submit emails for printing along with attachments.

Modernising IT includes Print

Dont let your on-prem print solutions hold you back!

ePRINTit allows you to connect existing, new, or bespoke printing solutions to the ePRINTit cloud service. With an array of options you can get up and running swiftly even without changing your print devices.

If you are in the process of renewing your printing estate or going into a tender process contact us and with our strategic partners we could save you more than you thought possible when moving to a true cloud printing solution.

Enhanced Security of your Print Infrastructure

The traditional on-prem print solutions continue to try and keep up with the demands of modern End User Computing scenarios but as they do they open more and more vulnerabilities to the print infrastructure.

With ePRINTit, either embedded on the device or with one of the ePRINTit release station devices, it only requires internet access. This means that the printer or device doesn't even need to be connect to the corporate network and can even be provisioned on a segregated network, like a guest network.

This means your print infrastructure is no longer a risk to your corporate security nor is there any on-prem infrastructure punching holes in firewalls or creating unnecessary VPNs.

Zero On-Prem Infrastructure Required

Like Office365 did for the heavy weight on-prem Exchange services, ePRINTit is doing it for the traditional on-prem, and unnecessary print infrastructure. Its 2019, you don't need it anymore!

ePRINTit is a fully tried and tested Cloud Print solution fit for the modern age.
